

Skippy

ACTION SUPPORT • CONNECTION • FOLLOW-THROUGH

A product governed and owned by **EMBRACE** Initiative

A closed-loop support platform for re-entry and recovery

PRODUCT OWNER & GOVERNANCE

TECHNICAL PARTNER

RECIPIENT	EMBRACE Initiative leadership and project team
PROPOSER	bioERGotech Foundation ETS
OBJECT	Design, build, launch and operation of the Skippy platform, promoted and owned by EMBRACE Initiative
SCOPE	Four delivery phases, from a 20-participant pilot to statewide operation
STATUS	Interface prototype complete and demonstrable. Production build not started.

Confidential working document, prepared to support discussion with EMBRACE leadership. Estimates of time, adoption and cost are declared assumptions, to be validated against the agreed perimeter. Trademarks reproduced belong to their respective owners and appear for identification purposes only.

Letter to EMBRACE Initiative

Dear EMBRACE Initiative leadership and project team,

Skippy begins with a practical insight. People returning from incarceration, living with substance-use challenges, or navigating severe instability rarely need another directory of services. They need help taking the next step, reaching the right human being, and staying supported until the step is complete.

We are proposing to build that platform with you, and to build it for the scale you have in mind. Twenty participants in a first cohort, five hundred across Baltimore, two thousand statewide, and an operating model that other re-entry programs could adopt after that. The pilot is small because the first question is narrow. The architecture is not small, and it is designed from the first line of code for where this is going.

The work is organized in four phases. Each phase delivers a complete, usable service rather than a fragment, and each adds the capabilities that the next level of scale actually calls for. Artificial intelligence is part of the platform and part of the plan. It is built into the architecture from the outset and its capabilities are switched on by phase, at the point where the content library and participant volume make them genuinely useful rather than decorative. We would rather earn each capability than ship all of them at once and validate none.

On the working relationship, we propose that each party owns the part it develops. Everything programmatic and informational belongs to EMBRACE: the participant relationship, the data, the consent record, the program rules, the provider content, the outcome definitions, the Skippy name, and everything the work produces. The technical layer that we build and maintain remains with us, and EMBRACE uses it without limit for Skippy's purposes. Section 8 sets this out as a proposal rather than a condition. It is the kind of thing worth working through together, and if your board or counsel prefers a different structure we are glad to build it and to be straightforward about what each option costs.

We have already taken the first step at our own expense. The prototype was built before approaching you, and we are not asking for it to be reimbursed.

Section 15 closes with the decisions we need in order to begin. The first three are enough.

Respectfully,

Guido Putignano

bioERGotech Foundation ETS

Executive summary

The problem. Information is fragmented, referrals frequently stop at a phone number, and programs have limited visibility into whether a participant actually connected or what prevented progress. A referral is counted when it is sent, even when no connection or service occurs. A missed action is read as disengagement rather than as a signal that transport, documents, literacy, trust, phone access or timing created a barrier.

The product. One platform, running one closed loop, expressed as three working objectives: Action Support, Connection and Follow-through. Every participant passes through all three, whatever their need. Authorized staff get a governed view of tasks, referrals, follow-ups and outcomes.

Delivery. Four phases, each a complete service.

Phase	Participants	Focus
1. Pilot	20	Prove the loop closes in one governed cohort
2. Baltimore	500	Multi-site operation, staffed safety response, program analytics
3. Statewide	2,000	Partner integrations, full AI assistance layer, community benefits
4. Beyond	Multi-program	Adoption by other re-entry programs under EMBRACE's model

Artificial intelligence. The AI service layer is part of the architecture from phase 1: content held as structured addressable records, a single governed service boundary for model calls, provenance on every output, workflow state kept deterministic and separate from presentation. Model-backed capabilities activate by phase. Reading-level adaptation and search across the content library at Baltimore scale, script and summary preparation at state scale, additional languages as the participant base requires them. Building the boundary first is what makes each activation a configuration decision rather than a rebuild, and what keeps crisis language, provider facts, eligibility statements and consent permanently outside model control.

Ownership. Each party owns the part it develops. Participants, data, consent, program rules, provider content, outcomes, the Skippy name and everything the work produces belong to EMBRACE. The technical layer remains with the Foundation and is used by EMBRACE without limit.

What we ask. A mandate, a named program owner, an agreed perimeter, and a collaboration agreement that lets construction begin.

The thesis in one line. Skippy creates value when it converts a need into a completed action and a verified connection. Phase 1 establishes that it does. Every phase after that widens who it does it for.

1. The opportunity

Existing resource directories answer *where might help exist*. They rarely answer the questions that matter after the first search. What should I do now? Did I reach anyone? What happened next? Who can help if the first option fails?

Where value is lost today.

- A participant is given several numbers and must decide alone which one to call.
- The same story is repeated across agencies, because consent-aware information does not travel with the participant.
- A referral is counted when it is sent, even when no connection or service occurs.
- A missed action is treated as disengagement rather than as a signal that a barrier exists.

Today	With Skippy
Information is the endpoint	A next action is agreed and prepared
A referral is a name or a phone number	A connection attempt, consent, status and outcome are recorded
Follow-up depends on staff memory	A bounded follow-up plan has an owner and a due date
Program learning comes from anecdotes	Structured outcomes show where the service fails

Why this belongs to EMBRACE. The platform can only be trustworthy if authority follows responsibility. EMBRACE defines the program, holds the participant relationship, maintains the provider relationships, decides how staff intervene, and is accountable to participants and partners. Product and data ownership should reflect that.

The core product is not chat. It is a closed-loop workflow that combines participant guidance with accountable human support.

2. The product

Skippy is one platform running one loop. What that loop does is expressed as three working objectives, and every participant passes through all three.

The working phrase *Push ups* is interpreted here as continued encouragement and follow-up. We recommend the participant-facing name **Follow-through**, subject to EMBRACE approval.

Objective	Promise to the participant	Capabilities	Proof of value
Action support	Help me take the next practical step	Guides, checklists, scripts, document preparation, reminders	Action started or completed
Connection	Help me reach the right trusted person or service	Curated providers, consented referral, directions, call preparation, handoff status	Connection attempted and outcome known
Follow-through	Stay with me when the first plan is difficult	Check-ins, barrier capture, rescheduling, staff follow-up, alternative route	Barrier addressed or next plan agreed

How the loop runs.

1. A participant identifies an immediate or longer-term need.
2. Skippy presents one clear action and prepares the participant to take it.
3. A provider or authorized EMBRACE staff member is connected when human support is required.
4. The system checks whether the action or connection succeeded, and records the structured outcome.
5. If a barrier remains, the plan is revised rather than silently abandoned.

Each objective must end in a visible state transition. More messages or longer conversations are not outcomes.

3. Delivery phases

Each phase delivers a service EMBRACE can operate, and adds the capabilities the next level of scale calls for. A phase begins when the previous one has met its gate.

Phase	Participants	What it delivers	Gate to the next
1. Pilot	20, one cohort	Participant experience, consent record, workflow engine, staff view, curated provider directory, referral and outcome tracking, reminders, plan card, structured export, AI service boundary	The loop closes at an acceptable rate, and staff use it
2. Baltimore	500, multiple sites	Staffed safety workflow, multi-site administration and role management, program analytics, expanded content library, reading-level adaptation and content search, access review tooling	Operating model holds across sites, and safety response meets its target
3. Statewide	2,000	Partner system integrations, full AI assistance including script and summary preparation, additional languages as the participant base requires, community benefits and partner discounts, capacity and resilience work	Service performance holds at volume, and outcomes justify wider adoption
4. Beyond	Multi-program	Adoption by other re-entry programs under EMBRACE's governance model, federated content, partner API, multi-tenant administration	Determined by EMBRACE strategy

Why capabilities land where they do

Capability	Phase	Rationale
Closed loop, consent, staff view	1	The core service. Everything else depends on it working
AI service boundary	1	Cheap to design alongside the architecture, expensive to retrofit. Built now so later activation is configuration, not reconstruction
Staffed safety response	2	A response queue implies staffed hours and a response target. It activates when EMBRACE has the coverage to honour it
Reading-level adaptation, content search	2	Both need a content library large enough that navigating it by hand is the bottleneck
Program analytics	2	Meaningful once there are enough participants for patterns to be real rather than anecdotal
Script and summary preparation	3	The highest-value AI capability and the one that most needs a validated content base and review workflow behind it
Additional languages	3	Activated when the participant base includes them, at which point the content service makes it a translation and review task rather than a parallel build
Partner integrations	3	Requires partners with systems worth integrating with, and a defined purpose and consent basis
Community benefits and discounts	3	A partnership milestone before it is a software milestone. EMBRACE recruits the businesses, we build the mechanism

The scope rule. Within a phase, a capability enters only if that phase's gate would be different without it. This keeps each phase deliverable and each gate meaningful.

4. Content and coverage

The five steps of the loop are the same whatever a participant needs. The software does not know or care whether the need is a birth certificate, a bus pass or a housing appointment. What differs between needs is not the product. It is the content attached to it.

Same for every need	Differs by need
The loop and its five steps	The curated providers, and whether they are confirmed
Workflow state and closure vocabulary	The prepared checklist and script
Consent, access and audit	The staff protocol and who owns it
Staff view and plan card	The content owner and review date

This distinction drives cost and risk. Content takes work to author, goes stale, and destroys trust when it does. Each area needs a named person at EMBRACE accountable for its accuracy. Coverage therefore expands deliberately, area by area, as the network behind it is confirmed.

Phase 1 coverage.

Area	Why it starts here
Documents and identity. Birth certificate, state ID, social security card	High frequency, verifiable outcome, well-defined agencies
Benefits applications and appointments	Clear submission and result states, and a barrier pattern worth measuring
Practical re-entry steps. Transport, phone access, employment-readiness administration	Same structure, and the needs participants raise most often alongside documents

Phase 2 coverage. Immediate stabilization, once the staffed safety workflow is live. Recovery and health support, once qualified partners are confirmed and the consent position is settled with counsel. Both are ready to author as soon as their conditions are met.

Needs outside current coverage. A participant is never turned away. The need is recorded and routed to staff by existing program practice, exactly as today. Those records tell EMBRACE which content to author next, and in what order, from observation rather than assumption.

5. Adoption

The largest risk in phase 1 is not technical. It is that a participant uses Skippy twice and stops, or that a staff member never opens it because it sits beside their workflow rather than inside it. Twenty participants with four active users answers nothing.

Part of the answer is subtraction. Few steps, no long forms, no account to create where an invitation works, no application to install. That removes the obstacle but does not create a reason to return. The rest of the answer is deliberate.

Measure	What it does
Plan card	The participant always has, in one place, their next step, when it is due, which documents they need and who to contact. A benefit independent of everything else, and among the cheapest things in the build
Assisted onboarding	A staff member walks the participant through the first action in person. First use is never cold
Bounded reminders	One channel, minimum content, hard frequency limit, no sensitive information in the message
Guide presence	A recognizable, non-intrusive presence that welcomes, reminds and acknowledges continued use
Staff placement	The staff view opens where staff already work, not in a separate tab nobody presides over

The rule governing the guide presence. It responds to the fact that a participant checked in, never to the content of what they reported. This is a technical separation before an editorial one: the engagement layer accesses the event, not the values. A cheerful acknowledgement to someone who has just recorded a failed connection would be, beyond unpleasant, an automated interpretation of their situation.

On streaks and counters. Counting continued use works when the task is optional and missing it carries no penalty. In a population under supervision, in recovery, or in unstable housing, a counter that resets can read as one more thing failed. We propose a count that pauses rather than resets, no leaderboards, no comparison between participants, and a pre-test with participants and staff before adoption. If it does not pass, it is replaced, and nothing in the architecture depends on it.

6. Data and privacy

Skippy collects the minimum structured information required to support agreed work. It does not become a repository for incarceration history, substance-use narratives, raw conversations, or unrestricted staff notes.

Domain	Examples	Handling
Identity and contact	Name or alias, safe contact channel	Separated from service records. Optional where possible
Consent	What may be stored, shared, and with whom	Versioned record, withdrawal supported
Needs and goals	Immediate priority, selected goal, urgency	Structured categories, minimum free text
Actions	Task, owner, due date, status, barrier	Retained for the active support period
Connections	Provider, consent, attempt, status, outcome	No provider disclosure beyond approved purpose
Safety events	Trigger, resource shown, staff action	Restricted access, separate retention
Telemetry	Errors, performance, feature use	No sensitive content in logs

Not retained by default. Raw audio. Full conversation transcripts after the support purpose ends. Clinical diagnoses or treatment records not required for navigation. Precise location history, contact lists, or unrelated device data.

7. Product boundaries

Skippy does	Skippy does not
Explain approved information in accessible language	Diagnose, prescribe, or recommend an individual treatment
Help prepare a script, checklist or question	Present itself as a clinician, attorney, probation officer or benefits authority
Present curated options and practical next steps	Rank people for access, eligibility, compliance or risk using opaque automation
Open the phone dialer, map, or approved referral flow	Claim a warm handoff or confirmed appointment when none occurred
Show approved urgent resources	Suggest that staff are monitoring a crisis unless a staffed protocol exists
Record a structured barrier with consent	Store unrestricted narratives because they may be useful later
Summarize participant-provided information for authorized staff	Send information to a provider without a defined purpose and consent

How the boundary is enforced. By architecture, not policy alone. Crisis language, provider facts, eligibility statements, consent, retention and workflow state are held in deterministic content and code on the far side of the AI service boundary. Model-backed capabilities operate on presentation and preparation only, never on pathway state, and their output is marked, traceable and reviewable.

If a function cannot be safely described when the AI is unavailable, it should not depend on AI. Building the boundary before the capability is what makes that rule enforceable rather than aspirational.

8. Ownership

This work produces two estates of different natures. One is programmatic and informational, and it is the reason the program exists. The other is technological, and it is the instrument that makes it possible. The principle we propose is that **each party owns the part it develops**.

Asset	Owner
Participant data, service records, datasets and their versions	EMBRACE Initiative
Consent records and consent policy	EMBRACE Initiative
Program rules, workflows, policies, escalation protocol	EMBRACE Initiative
Provider directory content and approvals	EMBRACE Initiative
Outcome definitions and measures	EMBRACE Initiative
Findings, reports and any publication	EMBRACE Initiative
The Skippy name and brand	EMBRACE Initiative
Platform, architecture, modules and technical know-how	bioERGOtech Foundation, in use to EMBRACE for Skippy's purposes
Guide presence and visual identity	bioERGOtech Foundation, in use to the program. If EMBRACE prefers to take it as its own, we will discuss it
Developments built for this program	Remain in the platform. EMBRACE uses them without limit for Skippy's purposes

Commitments that protect EMBRACE.

Commitment	Content
Accounts	Production accounts, domains, billing relationships and administrator recovery established for EMBRACE. Personal accounts are never used for production ownership
Data residence	Participant data resides in infrastructure designated by EMBRACE. No replication outside it
Export	Complete export in open documented format, available on request at any time, with schema and documentation
No secondary use	No use of participant data by the Foundation for any purpose without specific written authorization
No commercial use	No sale of data, no advertising-funded model, no participant-level cost profiling presented as performance
Exit	Documented export, operating procedures, credential transfer, and transition support to a successor of EMBRACE's choosing

How we would like to discuss this. The allocation above is a proposal, not a condition. It reflects how we think each organization can carry what it is equipped to carry. Other structures are entirely legitimate, including one in which EMBRACE commissions and retains the technical layer outright. That changes scope, cost and long-term maintenance responsibility, and we would rather work through those consequences with you than assume an answer on your behalf.

9. Roles and responsibilities

A supplier receives a specification, delivers, and withdraws. That is not the position we are asking for, and it is not the position that would let this work, because most decisions that matter are joint decisions: the content coverage, the consent approach, the escalation boundary, where staff work is placed, the outcome vocabulary.

Area	EMBRACE Initiative	bioERGOtech Foundation
Program strategy	Accountable. Mission, priorities, acceptance	Responsible. Discovery, options, product design
Service and safeguarding	Accountable. Policy, staffing, escalation	Consulted. Workflow implementation and controls
Content and providers	Accountable. Accuracy, approval, review dates	Responsible. Tooling and publishing workflow
Data governance	Accountable. Purpose, consent, retention, access	Responsible. Implement controls, support audits
Architecture and engineering	Approves material trade-offs	Accountable and responsible
Accounts and vendors	Owner and billing authority	Delegated administrator, least privilege
Operations	Accountable for program response and staff use	Responsible for uptime, triage, fixes, releases
Exit and transition	Selects successor, accepts handover	Responsible for export, training, credential transfer

What we commit to. The prototype was built at our own expense before approaching EMBRACE, and enters no calculation. We carry the platform over time, including maintenance, security and regulatory updating. We answer for operational success alongside the program owner, not only for the delivery of modules. We are available to seek resources together, including presenting jointly to prospective funders.

Repository administration, cloud access, vendor credentials and operational knowledge never remain solely with an individual. This applies to the Foundation as an organization, not to any person within it.

10. Security and compliance

Controls are proportionate to the phase. The table shows the phase 1 requirement and where each area develops.

Area	Phase 1	Later phases
Consent	Plain-language, purpose-specific, versioned, withdrawal supported	Automated consent lifecycle tooling
Access	MFA for staff, least privilege, assignment-based access	Automated periodic access review, multi-site roles
Data protection	Encryption in transit and at rest, managed secrets, tested backup and restore	Multi-region resilience
Audit	Authentication, record access, exports, consent and status changes	Audit analytics and anomaly detection
Retention	Domain-specific schedule with a documented owner	Automated deletion pipelines
Vendors	Inventory, data-flow map, agreements, exit plan	Formal subprocessor review programme
Safety	Approved static resources, explicit statement that the platform is not an emergency channel	Staffed queue, response matrix, drill exercises
AI	Service boundary with redaction, logging and version controls	Model integration behind the same boundary, with purpose limits and human escalation

Regulatory position. Applicability of HIPAA, 42 CFR Part 2, Maryland law and contractual duties depends on EMBRACE's role, partners, data sources and service model. Counsel should confirm the framework before production data is collected. The architecture follows minimum-necessary access, auditable authorization and confidentiality principles from the outset.

No participant is enrolled until the approved consent text, data-flow map, retention schedule, vendor register, incident plan and safety boundary statement are complete.

11. The pilot

Element	Proposal	Status
Sponsor and owner	EMBRACE Initiative	Confirmed in principle
Setting	One EMBRACE-governed program or partner cohort	To select
Participants	20 consenting adults	Confirmed target
Staff	3 to 5 trained users with named caseloads	Planning assumption
Coverage	Documents and identity, benefits, practical re-entry steps	To approve
Duration	8 to 12 weeks, after a 2-week readiness period	Planning assumption
Environment	EMBRACE-designated infrastructure. No personal accounts	Required
Primary measure	Does a need become a completed action and a verified connection	Proposed

What the pilot measures.

Measure	Purpose
First-week activation rate	Conditions everything downstream
Persistence at 2, 4 and 8 weeks	Adoption decay is the primary risk
Profile of those who stop	Distinguishes a tool problem from a barrier signal
Actions reaching a recorded closure state	The loop, directly measured
Referrals with a known outcome	The gap the product exists to close
Barriers recorded, by type	First quantification of what actually stops people
Needs raised outside current coverage	Tells EMBRACE what content to author next
Staff time to consult the participant view	Verifies the tool removes load rather than adding it
Staff-perceived usefulness	Determines whether the program proceeds to phase 2

Outputs. Usability and accessibility findings. Measured action, connection, follow-up and barrier outcomes. Validated operating procedures and role matrix. Technical, security and support findings. A prioritized phase 2 roadmap owned by EMBRACE.

12. Timeline

Phase 1, to a launch decision.

Stage	Work	Duration	Gate
Mobilize	Asset inventory, account plan, stakeholder interviews, risk register	2 weeks	Decisions 1 to 3
Define	Content blueprint, requirements, data and consent model, safety boundary, measurement plan	2 weeks	Named EMBRACE leads
Build	Workflow and data services, participant experience, staff view, consent, reminders, AI boundary	5 weeks	Decisions 4 to 6
Prepare	Content authoring, provider directory, training, security and privacy review, rehearsal	3 weeks	Acceptance gates passed
Operate	20 participants, weekly operations review, fixes	8 to 12 weeks	Launch authorization
Review	Findings, roadmap, phase 2 recommendation	2 weeks	Pilot complete

Approximately twelve weeks from mobilization to launch, then the measured pilot, assuming timely access to existing assets, available decision-makers, stable scope, and no major remediation discovered in the inventory.

Indicative phase durations after phase 1. Phase 2, six to nine months including site onboarding and safety workflow readiness. Phase 3, nine to twelve months, driven mainly by partner integration and content expansion rather than engineering. Phase 4 is a strategy decision rather than a schedule.

Construction begins only after coverage, access model, data boundaries, safety boundary and reminder channel are approved. The build stage does not start before decision 4, because an undefined reminder channel is the most common way a project of this type stalls.

13. Risks

Risk	Impact	Mitigation
Adoption decay	Four active users out of twenty answers nothing	Section 5 in full. Persistence measured as a primary endpoint
Staff do not open the tool	The loop has no human end, and the pilot fails for organizational reasons that look like product failure	Staff view placed inside an existing workflow moment. Named caseloads. Consultation time measured
Safety expectations outrun coverage	Participants may believe help is being monitored	Stabilization content and staffed queue arrive together in phase 2. Static resources and an explicit limit statement throughout
Scope expansion within a phase	The phase becomes hard to govern and slips	The scope rule in section 3. Every addition needs an owner, a benefit, a data need, a failure mode and a measure
Provider information goes stale	Bad information destroys trust at the moment of need	Named content owner, source, review date, expiry workflow. Coverage expands only as the network is confirmed
Over-collection	Increases harm and compliance burden without service value	Minimum schema, free-text restrictions, short retention, domain separation
The pilot answers a question nobody acts on	The most common failure of pilots	Decision points and owners agreed before launch, in section 15

Open assumptions. The pilot cohort, staff capacity, safeguarding coverage and participant eligibility are not confirmed. The access model, including whether guest access remains appropriate, requires a decision. The reminder channel is not chosen. Existing code, accounts, data, branding and vendor contracts require technical and legal inventory. *Follow-through* awaits approval. The acceptability of a guide presence for this population is untested.

14. Commercial model

We do not present a price list here. Without a confirmed perimeter there are no numbers, only the appearance of numbers. We set out where spend concentrates, so that EMBRACE can form a view and whoever seeks the resources has what they need.

Stage	Item	Cost driver
Mobilize	Inventory of existing code, accounts, data and vendors	Access to the current estate
Build	Workflow and data services, participant experience, staff view, consent	Phase perimeter
Build	Reminder engine	Channel decision
Build	Security implementation, documentation, data-flow map	Perimeter and channel
Prepare	Content authoring, provider directory, staff training, launch support	Staff count and coverage breadth
Operate	Hosting, monitoring, maintenance, support	Duration and active scale
Operate	Message sending, if the channel is metered	Channel and volume
Review	Export, measurement, findings	Measurement plan

Two principles. The recurring portion grows with actual enrolment, not projected enrolment: nobody pays for capacity they are not using. Third-party costs are visible and billed directly to EMBRACE-owned accounts wherever possible, so they are never hidden inside a fee.

A companion note, *Investment structure*, sets out the indicative investment and running cost for each phase, and how the economics develop as the program grows. It is available to EMBRACE and to prospective funders.

15. Decisions requested

We ask for specific decisions rather than general approval. The first three are enough to begin.

#	Decision	Rationale	Owner
1	Mandate and program owner. Name a Product and Program Owner with an explicit mandate over Skippy	Without a named owner the project stops at the first contested question	Executive Sponsor
2	Phase 1 perimeter. Confirm the cohort, coverage, staff count and duration	Everything else, including scope and cost, follows from this	Program Owner
3	Collaboration model. Confirm the arrangement and ownership allocation in section 8, or tell us which parts you would like to shape differently	The frame within which the two organizations work, and the premise for drafting the agreement	Executive Sponsor
4	Reminder channel. SMS via gateway, email, web link, or another solution	Determines part of the architecture and the risk profile. Construction does not start before this	Program Owner
5	Access and consent model. Invitation-based access, consent text, data boundaries, retention principles	Determines the information architecture and legal review	Data Governance Lead
6	Safety boundary. Approve the phase 1 static resource set and the wording that states the limit, and the conditions under which the staffed queue activates in phase 2	Determines what the interface may promise	Safeguarding Lead
7	Naming. Adopt or replace <i>Follow-through</i> , and confirm the Skippy name belongs to EMBRACE	Appears in consent materials and participant-facing content	Program Owner
8	Asset inventory. Authorize inventory and transfer planning for existing accounts, code, data and vendor relationships	Removes personal-account and continuity risk	Executive Sponsor
9	Phase gate ownership. Agree who decides whether phase 2 proceeds, and against which measures	The most common way a pilot is wasted is that nobody owns the decision it produces	Executive Sponsor

Recommended immediate decision. Authorize a short mobilization, with no production data collection and no irreversible platform commitment.

Appendix A. Module architecture

Phase reflects dependency as well as need. A module enters a phase only when everything it requires already exists.

#	Module	Function	Phase
S1	Workflow and data services	Tasks, owners, due dates, status, barriers, closure states. Server-side authorization	1
S2	Participant experience	Accessible, low-bandwidth, invitation-based, no install	1
S3	Consent record	Purpose, sharing permission, version, withdrawal	1
S4	Identity and access	Invitations, staff MFA, roles, assignment	1
S5	Content service and AI boundary	Structured addressable content, provenance, and the governed seam through which model calls pass	1
S6	Reminder engine	Bounded reminders on the chosen channel	1
S7	Staff view	Assigned participants, what is due, what is overdue, recorded barriers	1
S8	Provider directory	Approved resources with owner, source and review date	1
S9	Referral and outcome	Consented connection attempts and verified outcomes. Status never inferred from silence	1
S10	Plan card and engagement	Next step, documents and contacts. Guide presence with access to the event only	1
S11	Export and measurement	Structured export, indicators, audit evidence	1
S12	Safety workflow	Staffed queue, response matrix, escalation routing	2
S13	Analytics	Aggregated program measures and quality improvement	2
S14	Language assistance	Reading-level adaptation, content search, script and summary preparation, additional languages	2 and 3
S15	Partner integrations	Consented exchange with partner systems	3
S16	Community benefits	Approved partner benefits and discounts	3
S17	Multi-program administration	Federated content, tenant governance, partner API	4

Phase 1 acceptance gates. Accessibility review completed. Authorization and assignment controls tested with representative roles. Backup restoration, audit, incident and export procedures exercised. No unresolved critical security, privacy, safeguarding or data-integrity issue.

Appendix B. Capability release plan

Each capability has a condition, so that sequencing is a documented decision rather than an omission.

Capability	Phase	Condition
Staffed safety workflow	2	EMBRACE approves an owner, staffed hours, a response target and a documented fallback
Immediate stabilization content	2	Released together with the staffed workflow above
Recovery and health support content	2	Qualified partners confirmed and consent position settled with counsel
Reading-level adaptation, content search	2	Content library large enough that navigating it by hand is the bottleneck
Program analytics	2	Participant numbers exceed what a structured export can serve, in practice above one hundred
Script and summary preparation	3	Validated content base and an established review workflow behind it
Additional languages	3	Participant base includes them. The content service makes this translation and review rather than a parallel build
Partner integrations	3	A partner with a system worth integrating with, and a defined purpose and consent basis
Community benefits and discounts	3	EMBRACE has recruited partner businesses
Native applications	3	Evidence that web access is a material barrier for the cohort
Multi-program adoption	4	EMBRACE strategy decision
